Module 3 Limit State of Collapse - Flexure (Theories and Examples)

Lesson 7 Numerical Problems on Singly Reinforced Rectangular Beams (Continued)

Instructional Objectives:

At the end of this lesson, the student should be able to:

• Apply the principles to analyse a given cross-section of a beam with specific reinforcement to determine its moment of resistance.

3.7.1 Introduction

 This lesson explains the determination of moment of resistance of given singly reinforced rectangular beam sections with the help of illustrative analysis type of problem. The numerical problem is solved by (i) direct computation method, (ii) using charts of SP-16 and (iii) using tables of SP-16. Step by step solutions illustrate the procedure clearly.

3.7.2 Analysis Type of Problems

 It may be required to estimate the moment of resistance and hence the service load of a beam already designed earlier with specific dimensions of *b*, *d* and *D* and amount of steel reinforcement *Ast*. The grades of concrete and steel are also known. In such a situation, the designer has to find out first if the beam is under-reinforced or over-reinforced. The following are the steps to be followed for such problems.

$3.7.2.1 \text{ X}_{\text{U}}$ *max*

 The maximum depth of the neutral axis *xu*, *max* is determined from Table 3.2 of Lesson 5 using the known value of *fy*.

3.7.2.2 *xu*

 The depth of the neutral axis for the particular beam is determined from Eq. 3.16 of Lesson 5 employing the known values of *fy*, *fck*, *b* and *Ast*.

3.7.2.3 *Mu* **and service imposed loads**

 The moment of resistance *Mu* is calculated for the three different cases as follows:

- (a) If $x_u < x_{u, max}$, the beam is under-reinforced and M_u is obtained from Eq. 3.22 of Lesson 5.
- (b) If $x_u = x_{u, max}$, the M_u is obtained from Eq. 3.24 of Lesson 5.

(c) If $x_u > x_u$ max, the beam is over-reinforced for which x_u is taken as x_u m_{max} and then M_u is calculated from Eq. 3.24 of Lesson 5, using $x_u = x_u$ *max*.

 With the known value of *Mu*, which is the factored moment, the total factored load can be obtained from the boundary condition of the beam. The total service imposed loads is then determined dividing the total factored load by partial safety factor for loads $(= 1.5)$. The service imposed loads are then obtained by subtracting the dead load of the beam from the total service loads.

3.7.3 Analysis Problems 3.2 and 3.3

 Determine the service imposed loads of two simply supported beam of same effective span of 8 m (Figs. 3.7.1 and 2) and same cross-sectional dimensions, but having two different amounts of reinforcement. Both the beams are made of M 20 and Fe 415.

Fig. 3.7.1: Analysis Problem 3.2

3.7.4 Solution by Direct Computation Method - Problem 3.2

Given data: $b = 300$ mm, $d = 550$ mm, $D = 600$ mm, $A_{st} = 1256$ mm² (4-20 T), $L_{\text{eff}} = 8$ m and boundary condition = simply supported (Fig. 3.7.1).

3.7.4.1 *xu***,** *max*

From Table 3.2 of Lesson 5, we get $x_{u, max} = 0.479$ $d = 263.45$ mm

3.7.4.2 *xu*

$$
x_u = \frac{0.87 \ f_y \ A_{st}}{0.36 \ b \ f_{ck}}
$$

(3.16)

$$
= \frac{0.87 (415) (1256)}{0.36 (300) (20)}
$$

 $= 209.94385$ mm < $x_{u, max} = (263.45$ mm)

Hence, the beam is under-reinforced.

3.7.4.3 *Mu* **and service imposed loads**

For
$$
x_u < x_u
$$
, max , we have
\n
$$
M_u = 0.87 f_y A_{st} (d - 0.42 x_u)
$$
\n(3.22)\n
$$
= 0.87 (415) (1256) {550 - 0.42(209.94385)}
$$
\n
$$
= 209.4272 \text{ kNm}
$$

Total factor load
$$
F_d = \frac{8 M_u}{L_{eff}^2} = \frac{8 (209.4272)}{8 (8)}
$$

= 26.1784 kN/m

Total service load = $\frac{1}{17}$ = $\frac{20.1764}{17}$ = 17.452266 1.5 $\frac{F_d}{1.5}$ = $\frac{26.1784}{1.5}$ = 17.452266 kN/m

Dead load of the beam = 0.3 (0.6) (25) = 4.5 kN/m

Hence, service imposed loads = $(17.452266 - 4.5)$ kN/m

$$
= 12.952266
$$
 kN/m

3.7.5 Solution by Direct Computation Method - Problem 3.3

Fig. 3.7.2: Analysis Problem 3.3

Given data: $b = 300$ mm, $d = 550$ mm, $D = 600$ mm, $A_{st} = 1658$ mm² (4-20 T $+ 2-16$ T), $L_{\text{eff}} = 8$ m and boundary conditions = simply supported (Fig. 3.7.2)

3.7.5.1 *xu***,** *max*

From Table 3.2 of Lesson 5, we get $x_{u, max} = 0.479 d = 263.45 mm$

3.7.5.2 *xu*

$$
x_{u} = \frac{0.87 f_{y} A_{st}}{0.36 b f_{ck}}
$$

(3.16)

$$
= \frac{0.87 (415) (1658)}{0.36 (300) (20)}
$$

= 277.13924 mm > $x_{u, max}$ = (263.45 mm)

Hence, the beam is over-reinforced.

3.7.5.3 *Mu* **and service imposed loads**

For x_u > $x_{u,max}$, we have

$$
M_{u} = 0.36 \frac{x_{u, \max}}{d} (1 - 0.42 \frac{x_{u, \max}}{d}) b d^{2} f_{ck}
$$
 (3.24)

 $= 0.36$ (0.479) {1 - 0.42(0.479)} (300) (550) (550) (20) Nmm

= 250.01356 kNm

If we use Eq. 3.22 using $x_u = x_{u,max}$, for M_u

 $M_u = 0.87 f_y A_{st} (d - 0.42 x_{u, max})$ (3.22)

Then, (*Mu*)*steel* = 0.87 (415) (1658) {550 - 0.42 (263.45)} Nmm

$$
= 263.00468
$$
 kNm $> (M_u)_{\text{concrete}}$ (= 250.01356 kNm)

The higher *Mu* as obtained from steel is not true because the entire amount of steel (1658 mm²) cannot yield due to over-reinforcing. Prior to that, concrete fails at 250.01356 kNm. However, we can get the same of *Mu* as obtained from Eq. 3.24 of Lesson 5, if we can find out how much A_{st} is needed to have $x_u = 263.45$ mm. From Eq. 3.16 of Lesson 5, we can write:

$$
(A_{st})_{needed\ for\ x_u = 263.45} = \frac{0.36 \ b \ f_{ck} \ x_u}{0.87 \ f_y}
$$

$$
= \frac{0.36 (300) (20) (263.45)}{0.87 (415)}
$$

$$
= 1576.1027 \ mm^2
$$

If we use this value for *Ast* in Eq. 3.22 of Lesson 5, we get

 (M_u) = 0.87(415)(1576.1027){550 - 0.42(263.45)}

 $= 250.0135$ (same as obtained from Eq. 3.24).

From the factored moment M_{u} = 250.01356 kNm, we have:

Total factored load = $F_d = \frac{3!}{2} \frac{1}{2} = \frac{3!}{2} \frac{3!}{2} = 31.251695$)8(8 $= \frac{8 M_u}{I^2} = \frac{8(250.01356)}{8(8)}$ *eff* $\frac{d}{d} = \frac{6 M_u}{L_{eff}^2}$ $F_d = \frac{8 M_u}{a^2} = \frac{8(250.01356)}{a^2} = 31.251695$ kN/m

Total service load =
$$
\frac{31.251695}{1.5}
$$
 = 20.834463 kN/m

Now, Dead load of the beam = 0.3 (0.6) (25) = 4.5 kN/m

Hence, service imposed loads = $20.834463 - 4.5 = 16.334463$ kN/m

3.7.6 Solution by Design Chart - Problems 3.2 and 3.3

 For the two problems with known *b, d, D, Ast*, grade of concrete and grade of steel, chart 14 of SP-16 is applicable. From the effective depth *d* and percentage of reinforcement $p_{_t}$ (= $\frac{A_{_{st}}100}{b\ d}$), the chart is used to find $M_{\!u}$ per metre width. Multiplying *Mu* per meter width with *b*, we get *Mu* for the beam. After that, the service imposed load is calculated using the relation

Service imposed load =
$$
\frac{8 M_u}{(1.5) L^2}
$$
 - Dead load

(3.27)

The results of the two problems are furnished in Table 3.7.

Table 3.7 Results of Problems 3.2 and 3.3 (Chart of SP-16)

3.7.7 Solution by Design Tables - Problems 3.2 and 3.3

 Table 2 of SP-16 presents the value of reinforcement percentage for different combinations of f_y and (M_y/bd^2) for M-20. Here, from the known values of p and f_y , the corresponding values of M_y/bd^2 are determined. These in turn give *Mu* of the beam. Then the service imposed load can be obtained using Eq. 3.27 as explained in the earlier section (sec. 3.7.6). The results of the two problems are presented in Table 3.8.

Table 3.8 Results of Problems 3.2 and 3.3 (Table of SP-16)

* Linear interpolated $\frac{M_u}{b d^2}$ = 2.30 + $\frac{(0.7612 - 0.757)}{(0.765 - 0.757)}$ (2.32 - 2.30) *db* $\frac{M_u}{M_u}$ = 2.30 + $\frac{(0.7612 - 0.757)}{(0.7612 - 0.757)}$ (2.32 – 2.30) = 2.3105

** $p_t = 1.2058181$ is not admissible, i.e. over-reinforced. So at $p_t = 0.955$, M_u/bd^2 *=*2.76.

3.7.8 Comparison of Results of Three Methods

 The values of *Mu* and service imposed loads of the under-reinforced and over-reinforced problems (Problems 3.2 and 3.3), computed by three methods, are presented in Table 3.9.

Table 3.9 Comparison of results of Problems 3.2 and 3.3

3.7.9 Practice Questions and Problems with Answers

- **Q.1:** Determine the moments of resistance M_u and service imposed loads on a simply supported beam of effective span 10.0 m with *b* = 300mm, *d* = 500 mm, *D* = 550 mm and grades of concrete and steel are M20 and Fe500, respectively for the two different cases employing (a) direct computation method and (b) using charts and tables of SP-16: (i) when *Ast* is minimum acceptable and (ii) when A_{st} is maximum acceptable (Fig. 3.7.3).
- **A.1:** Given data: $b = 300$ mm, $d = 500$ mm, $D = 550$ mm, $L_{\text{eff}} = 10.0$ m, $f_{ck} =$ 20 N/mm² and $f_y = 500$ N/mm².

Fig. 3.7.3: Problem of Q_1 1

(a) Direct computation method:

Case (i) When *Ast* is minimum acceptable (Eq. 3.26 of Lesson 6) Minimum *s* $-f_y$ $A_{s} = \frac{0.85 b d}{a}$ (3.26)

So, $A_s = \frac{0.5(300)(500)}{500}$ mm² = 255 mm². Providing 4-12T gives $A_{st} = 452$ $mm²$.

Equation 3.16 of Lesson 5 gives the depth of the neutral axis *xu*:

$$
x_u = \frac{0.87 f_y A_{st}}{0.36 b f_{ck}} = \frac{0.87 (500) (452)}{0.36 (300) (20)} = 91.03 \text{ mm}
$$

Table 3.2 of Lesson 5 gives $x_{u, max} = 0.46(500) = 230$ mm.

The beam is, therefore, under-reinforced (as $x_u < x_u$, $_{max}$).

Equation 3.22 of Lesson 5 gives the *Mu* as follows:

$$
M_{u} = 0.87 f_{y} A_{st} (d - 0.42 x_{u})
$$
\n(3.22)\n
$$
= 0.87(500) (452) \{500 - 0.42(91.03)\} \text{ Nmm}
$$
\n
$$
= 90.79 \text{ kNm}
$$

Total factored load = $\frac{6.77}{2}$ = $\frac{6.7637}{2}$ = 7.26 100 $\frac{8 M_u}{I^2} = \frac{8 (90.79)}{100} =$ *eff u L* $\frac{M_u}{M_u}$ = $\frac{8(90.79)}{1000}$ = 7.26 kN/m

The dead load of the beam = 0.3 (0.55) (25) = 4.125 kN/m

So, the service imposed loads = $\{$ (Total factored load)/(Load factor) $\}$ - (Dead load)

$$
= 7.26/1.5 - 4.125 = 0.715
$$
 kN/m

This shows that the beam can carry maximum service imposed loads, 17 per cent of its dead load only, when the acceptable minimum tensile reinforcement is 452 mm² (4 bars of 12 mm diameter).

Case (ii) when *Ast* is maximum acceptable:

 To ensure ductile failure, it is essential that the acceptable maximum tensile reinforcement should be between 75 and 80 per cent of *pt, lim* and not as given in clause $26.5.1.1(k)$, i.e. 0.04 *bD*. Thus, here the maximum acceptable p_t should be between 0.57 and 0.61 per cent (as $p_{t, lim} = 0.76$ from Table 3.1 of Lesson 5). However, let us start with 0.76 per cent as the span is relatively large

and keeping in mind that while selecting the bar diameter, it may get reduced to some extent.

So,
$$
(A_{st})_{max} = 0.76 (300) (500)/100 = 1140
$$
 mm²

Selecting 4-16 and 2-12 mm diameter bars, we get $A_{st} = 1030$ mm² when p_t becomes 0.67 per cent. So, the maximum acceptable tensile reinforcement is 1030 mm².

207.43 $=\frac{0.87 f_y A_{st}}{0.36 b f_{ck}} = \frac{0.87 (500) (1030)}{0.36 (300) (20)}$ *ck* $y \sim s$ μ ^{*u*} 0.36 *b f* f_{v} *A* $x_u = \frac{3.84 \times 10^{3} \text{ y}}{2.00 \times 10^{3} \text{ s}} = \frac{3.64 \times 10^{3} \text{ s}}{2.00 \times 10^{3} \text{ s}} = 207.43 \text{ mm}$ (Eq. 3.16 of Lesson 5)

 $x_u < x_u$ max (as x_u max = 230 mm; see Case (i) of this problem).

Therefore, *Mu* is obtained from Eq. 3.22 of Lesson 5 as,

$$
M_u = 0.87 f_y A_{st} (d - 0.42 x_u)
$$
\n(3.22)

 $= 0.87(500)$ (1030) {500 - 0.42(207.43)} Nmm

 $= 184.99$ kNm

Total factored load = $\frac{6.14}{2}$ = $\frac{6.164.333}{100}$ = 14.8 100 $\frac{8 M_u}{I^2} = \frac{8 (184.99)}{100} =$ *eff u L* $\frac{M_u}{M_u}$ = $\frac{8(184.99)}{M_u}$ = 14.8 kN/m

With dead load $= 4.125$ kN/m (see Case (i) of this problem), we have:

Service imposed load = $14.8/1.5 - 4.125 = 5.74$ kN/m

This beam, therefore, is in a position to carry service imposed loads of 5.74 kN/m, about 40% higher than its own dead load.

(b) Using chart and tables of SP-16:

Tables 3.10 and 3.11 present the results using charts and tables respectively of SP-16. For the benefit of the reader the different steps are given below separately for the use of chart and table respectively for the minimum acceptable reinforcement.

The steps using chart of SP-16 are given below:

- Step 1: With the given f_{ck} , f_{y} and d , choose the particular chart. Here, for f_{ck} = 20 N/mm², f_y = 500 N/mm² and $d = 500$ mm, the needed chart no. is 17.
- Step 2: Chart 17 shows minimum $p_t = 0.13\%$ which gives $A_{st} = 195$ mmm²
- Step 3: Provide bars of 4-12 mm diameter, which give $p_t = 0.301\%$
- Step 4: For $p_t = 0.301$, Chart 17 shows $M_u = 300$ kNm per metre width, which gives $M_{\text{u}} = 300 (0.3) = 90$ kNm for the beam.
- Step 5: The service imposed loads are calculated as follows:

Service imposed loads = $\frac{6.01}{2}$ - 4.125 = 0.675 (1.5) $\frac{8 M_u}{2 (1.5)} - 4.125 =$ *eff u L* $\frac{M_u}{M_{\text{max}}}$ – 4.125 = 0.675 kN/m, using

the dead load of the beam as 4.125 kN/m (see case (i) of this problem).

Step 6: The capacity of the beam is to carry 0.675 kN/m which is (0.675/4.125) $100 = 16.36\%$.

Table 3.10 Results of Q.1 using chart of SP-16

Similar calculations are done for the maximum acceptable reinforcement. The steps are given below:

Step 1: With the given $f_{ck} = 20 \text{ N/mm}^2$, $f_y = 500 \text{ N/mm}^2$, Table 2 of SP-16 is selected.

Step 2: $(p_t)_{min} = 0.07$ from Table 2, which gives $A_{st} = 105$ mmm²

- Step 3: Provide bars of 4-12 mm diameter, which give $p_t = 0.301\%$
- Step 4: For $(p_t)_{provided}$, we get (M_u/bd^2) from Table 2 of SP-16 by linear interpolation as follows:

$$
\frac{M_u}{b d^2} = 1.20 + \frac{(1.25 - 1.2)(0.301 - 0.298)}{(0.312 - 0.298)} = 1.204
$$

Hence, $M_u = 1.204 (300) (500)^2 = 90.3$ kNm

Step 5: Same as Step 5 while using chart of SP-16.

Step 6: Same as Step 6 while using chart of SP-16.

Table 3.11 Results of Q.1 using table of SP-16

3.7.11 Test 7 with Solutions

Maximum Marks = 50. Maximum Time = 30 minutes

TQ.1: Determine the moment of resistance for the beams shown in Figs. 3.7.4 and 3.7.5 using M 20 and Fe 250 by direct computation and using charts and tables of SP-16.

Fig. 3.7.4: Problem of Test 7, TQ. 1A

A.TQ.1: Case A: TQ.1 A of Fig. 3.7.4

(i) Direct computation method

$$
A_{\text{st}} = 1963 \text{ mm}^2 \ (4-25 \ \phi)
$$

$$
x_{u,\text{max}} = 0.53 \ (450) = 238.5 \text{ mm} \ (Table 3.2 \text{ of Lesson 5 gives 0.53})
$$

$$
0.87 f_{y} A_{y} = 0.87 \ (250) \ (1963)
$$

$$
x_{u} = \frac{0.87 f_{y} A_{st}}{0.36 b f_{ck}} = \frac{0.87 (250)(1963)}{0.36 (300)(20)} = 197.66
$$
 (See Eq. 3.16 of Lesson 5)

So, $x_u < x_{u, \text{max}}$ shows that it is under-reinforced section for which M_u is obtained from Eq. 3.22 of Lesson 5

$$
M_u = 0.87 f_y A_{st} (d - 0.42 x_u)
$$
\n(3.22)

- $= 0.87(250)$ (1963) {450 0.42(197.66)}
- = 156.68 kNm
- (ii) Chart of SP-16
- A_{st} = 1963 mm²

$$
p_t = \frac{A_{st} (100)}{b d} = \frac{1963 (100)}{300 (450)} = 1.45
$$

From chart 11 of SP-16, when $p_t = 1.45$, $d = 450$, we get

 M_u per metre width = 522 kNm/m

Mu = 522 (0.3) = 156.6 kNm

(iii) Table of SP-16

Table 2 of SP-16 is for M-20 and Fe250. At $p_t = 1.451$, we get

$$
\frac{M_u}{b d^2} = 2.58 \text{ N/mm}^2
$$

So, M_u = 2.58 (300) (450) (450) (10⁻⁶) kNm = 156.74 kNm

The three values of M_u are close to each other.

Fig. 3.7.5: Problem of Test 7, TQ. 1B

A.TQ.1: Case B: TQ.1 B of Fig. 3.7.5

(i) Direct computation method

 A_{st} = 1963 + 981 = 2944 mm² (6-25 φ)

 296.44 $=\frac{0.87 f_y A_{st}}{0.36 b f_{ck}} = \frac{0.87 (250)(2944)}{0.36 (300)(20)}$ *ck* \sum_{s} $u = 0.36 b f$ $f_{\rm v}$ A $x_u = \frac{\cos \frac{u}{\cos \theta} x_{st}}{0.001 \cdot 0.001 \cdot 0.001 \cdot 0.001} = 296.44$ mm (See Eq. 3.16 of

Lesson 5)

 $x_{u, \text{max}} = 0.53$ (450) = 238.5 mm (Table 3.2 of Lesson 5 gives 0.53)

So, $x_u > x_{u, max}$ and the beam is over-reinforced. In such a situation, we take $x_u = x_{u, max} = 238.5$ mm. The M_u will be calculated from Eq. 3.24 of Lesson 5.

$$
M_{u} = M_{u, \text{lim}} = 0.36 \frac{x_{u, \text{max}}}{d} (1 - 0.42 \frac{x_{u, \text{max}}}{d}) bd^{2} f_{ck}
$$
\n(3.24)

 $= 0.36 (0.53) (1 - 0.42 (0.53)) (300) (450)^2 (20)$ Nmm

 $= 180.22$ kNm

(ii) Chart of SP-16

2.18 300(450) $p_t = \frac{2944(100)}{200(150)}$ = 2.18. In chart 11 (for M 20 and Fe 250), maximum admissible p_t is 1.75 and for this p_t when $d = 450$, $M_u = 600$ kNm/m.

So, *Mu* = 600 (0.3) = 180 kNm

(iii) Table of SP-16

Table 2 (for M 20 and Fe 250) has the maximum $p_t = 1.76$ and at that value, $(M_u/bd^2) = 2.98$. This gives

 M_u = 2.98 (300) (450)² (10⁻⁶) = 181.03 kNm. Here also the three values of *M_u* are close to each other.

3.7.12 Summary of this Lesson

 This lesson explains the use of equations derived in Lesson 5 for the analysis type of problems. The three methods (i) direct computation, (ii) use of charts of SP-16 and (iii) use of tables of SP-16 are illustrated through the step by step solutions of numerical problems. Their results are compared to show the closeness of them.
